

Help science study the risks of sea-level rise
by uploading pictures of coasts.

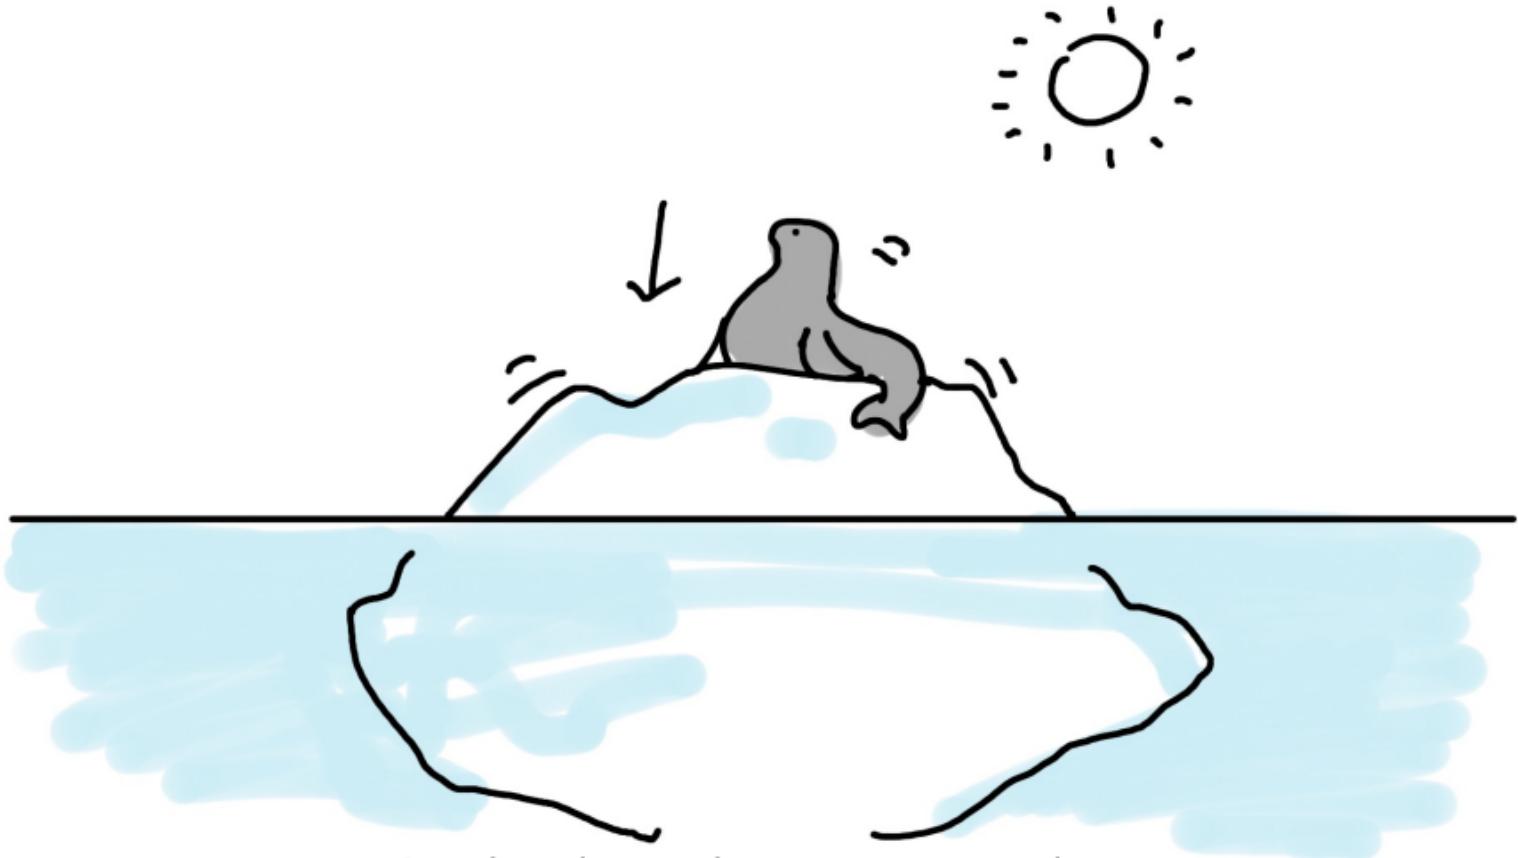

Help science study the risks of sea-level rise
by uploading pictures of coasts.

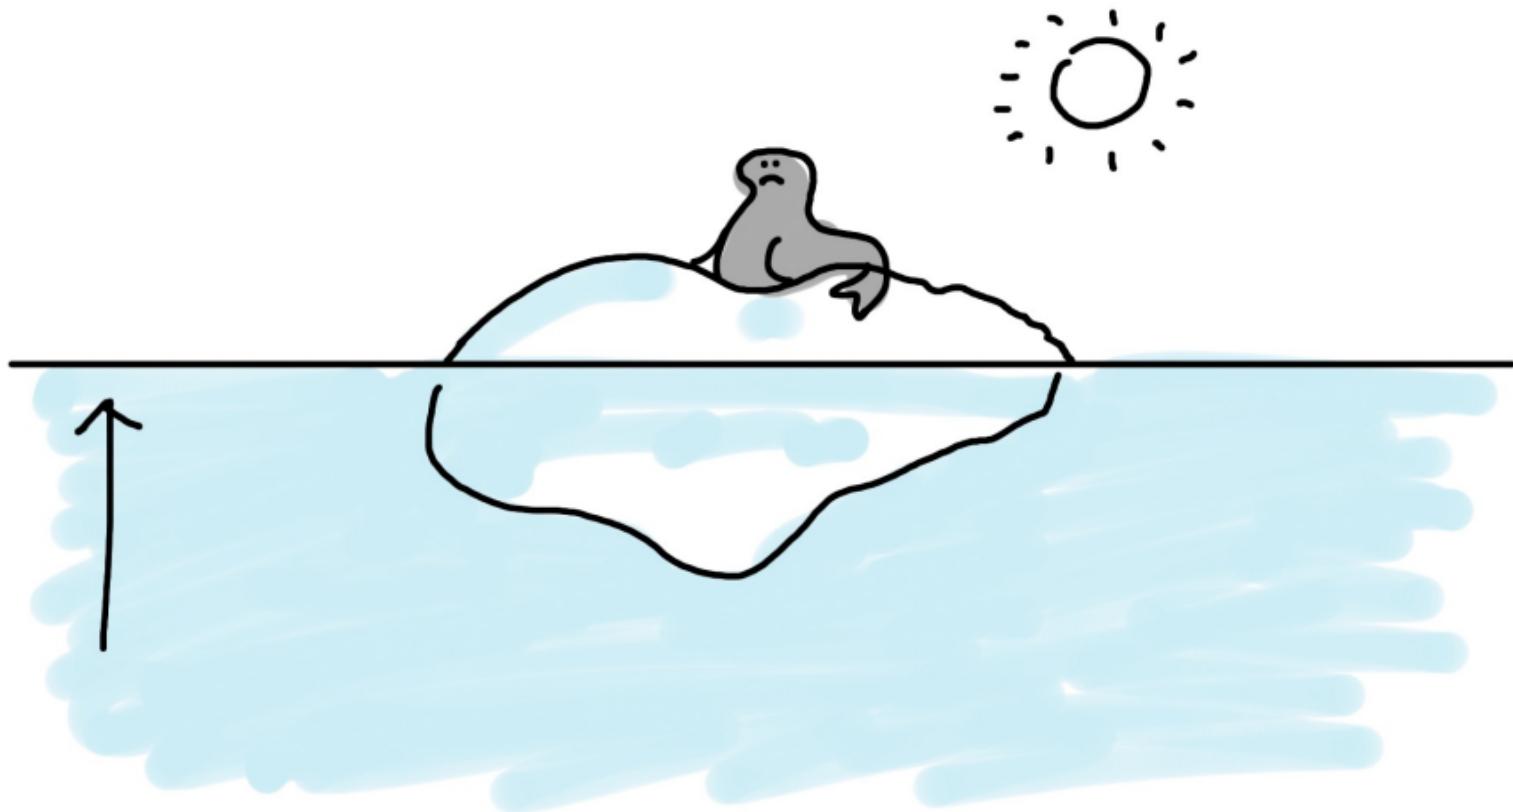

(we know you have some)

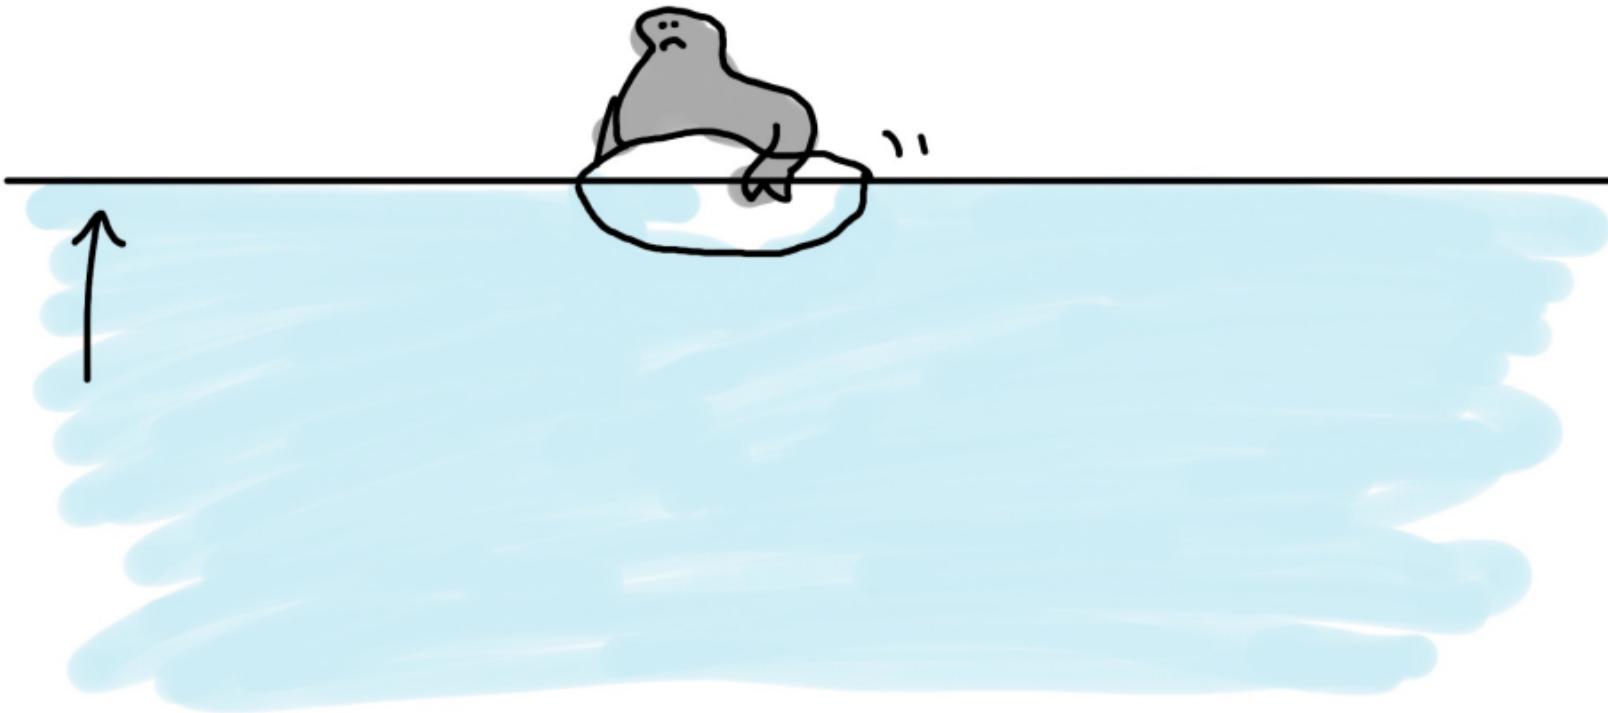

No passwords, no account. Just drag and drop.

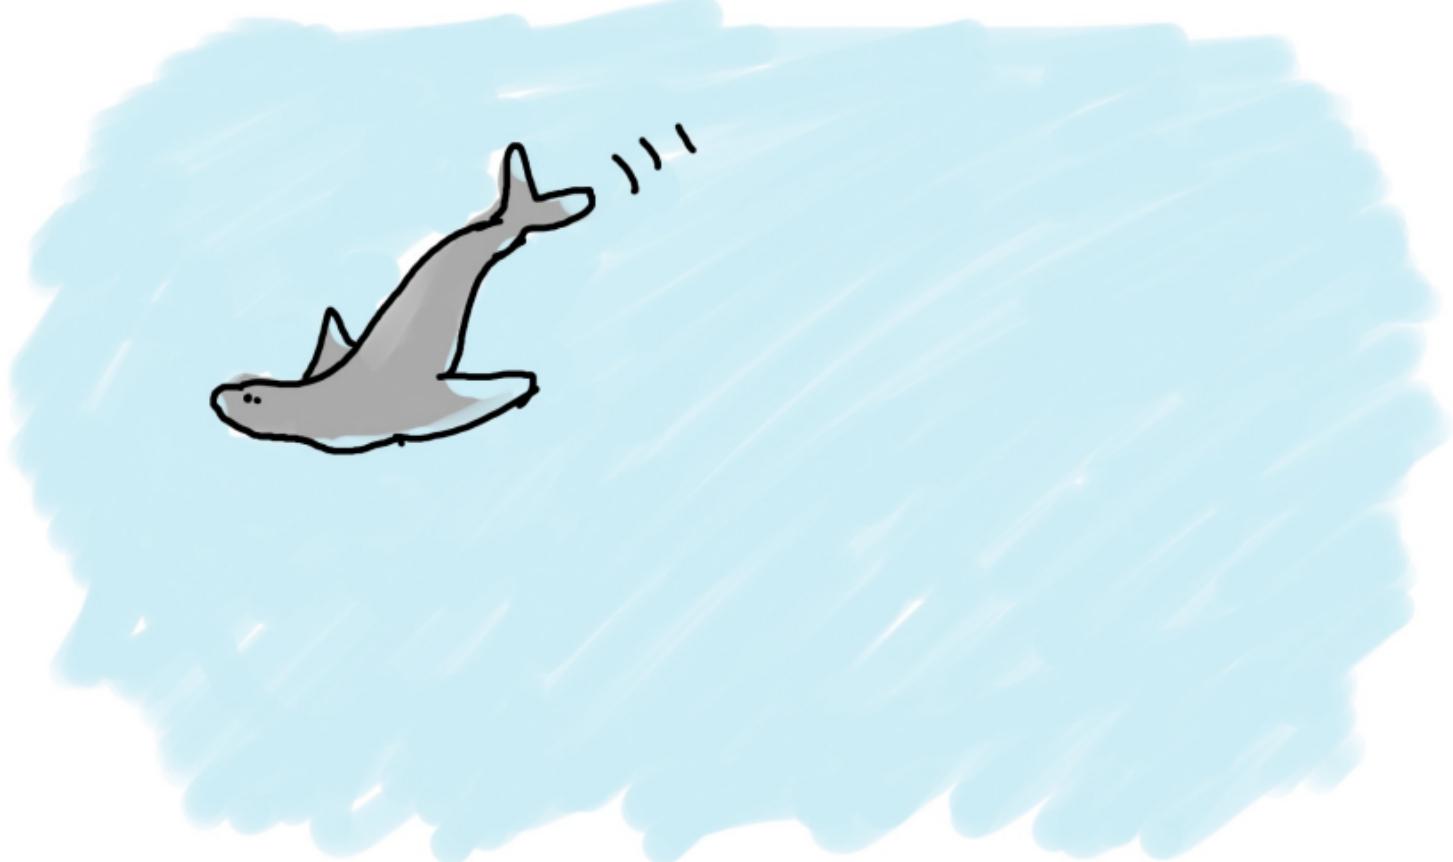

Sea-levels rise because ice melts

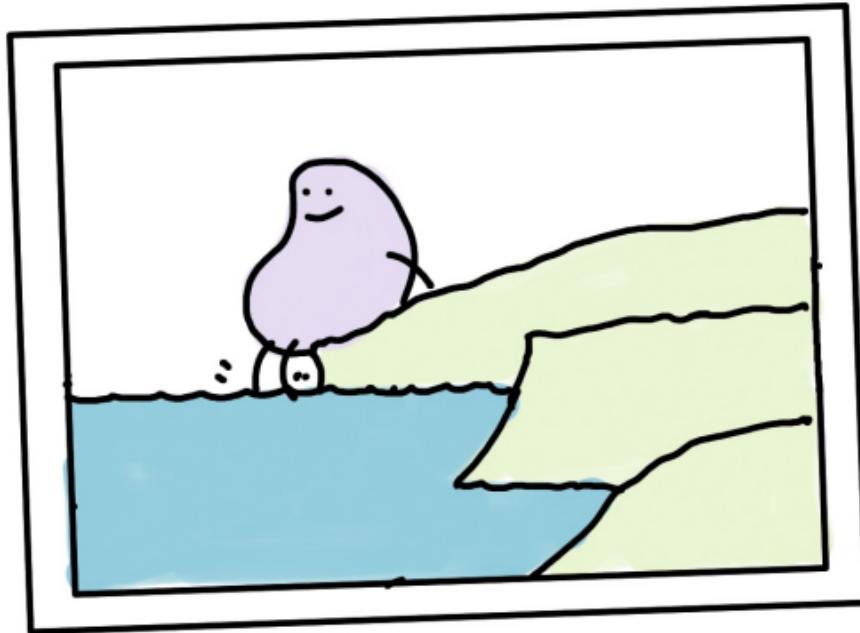

and our oceans absorb the excess heat and expand

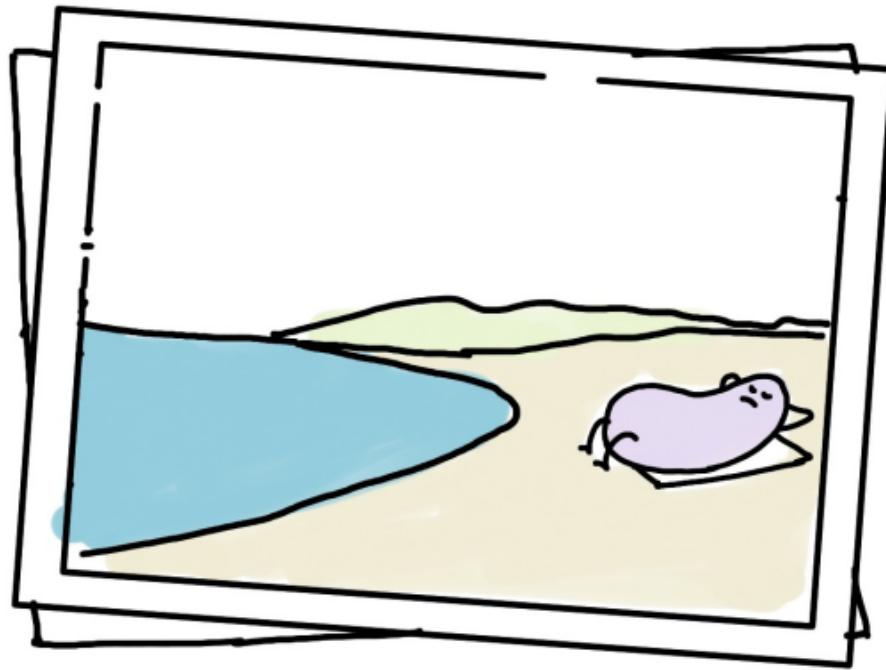

a slow but steady chain reaction, that will become
more and more extreme as time goes on

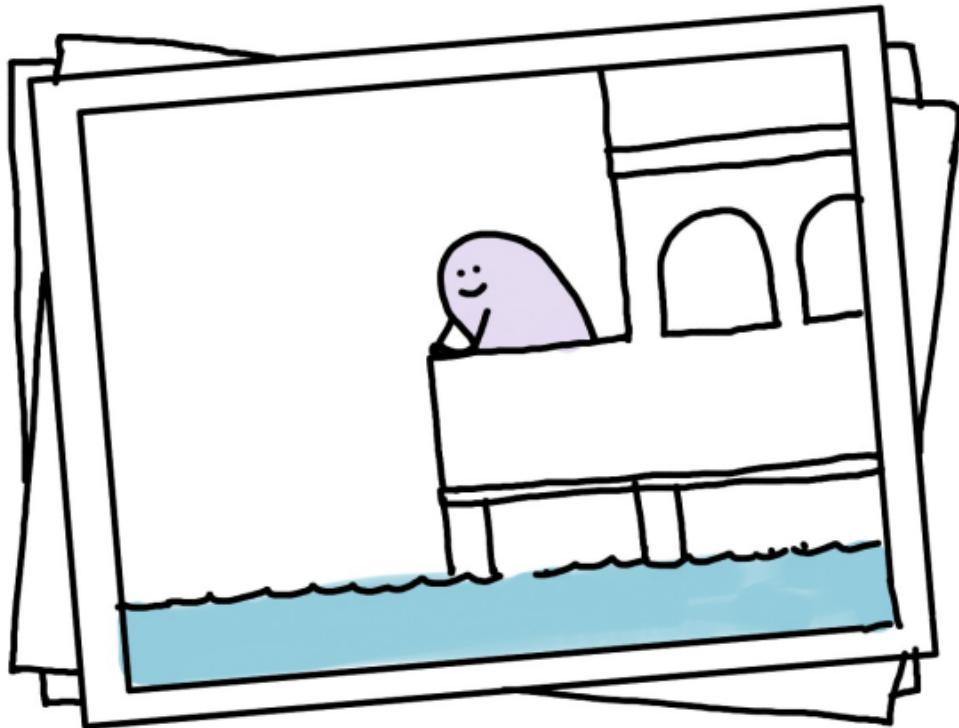

Only, it doesn't play out evenly.

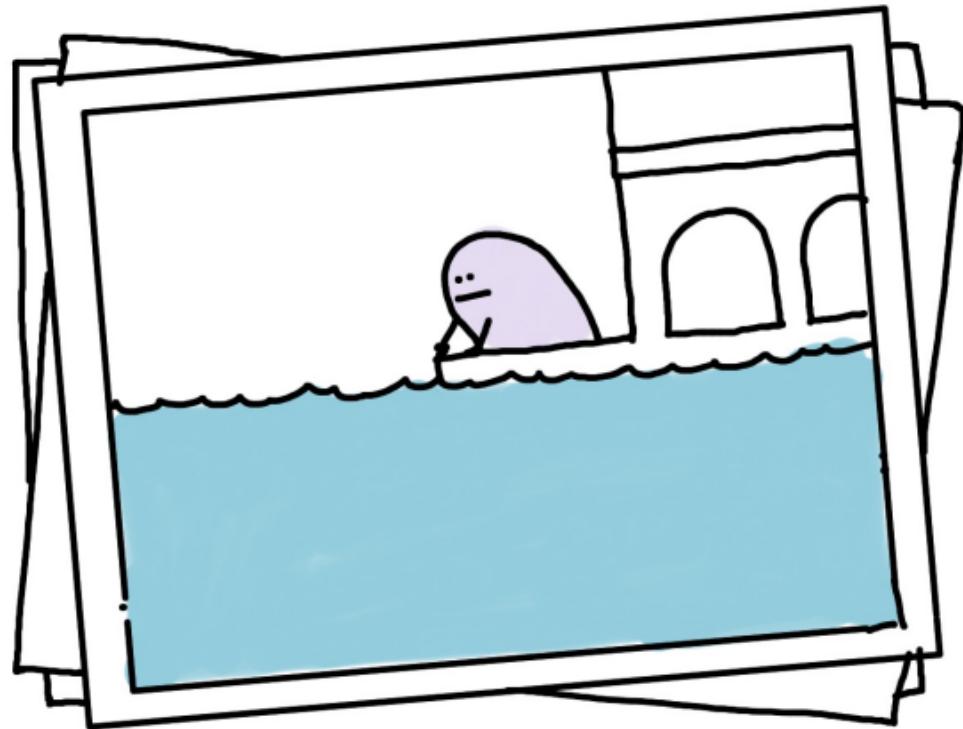

Sea-levels vary drastically from place to place

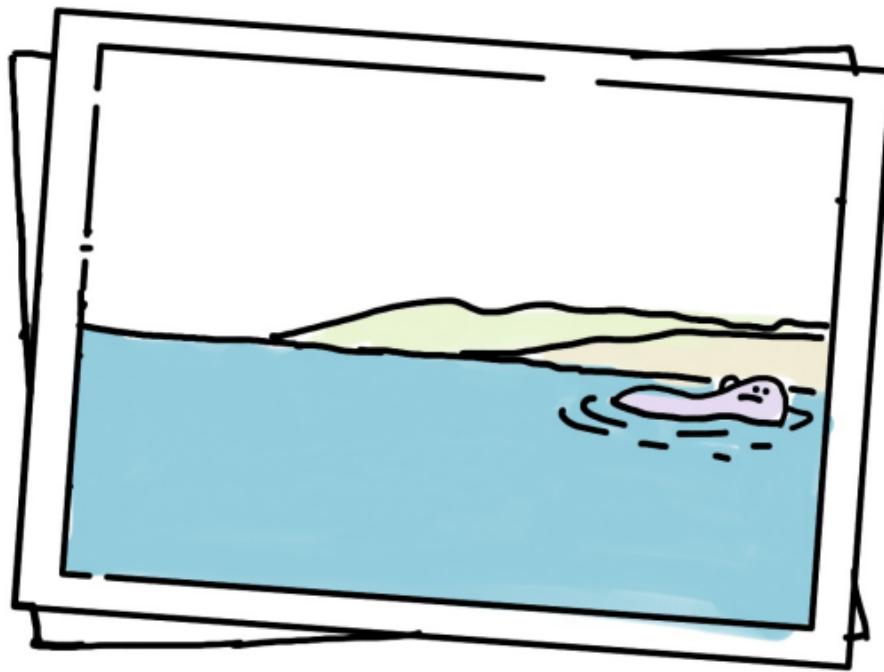

and every coast reacts differently,

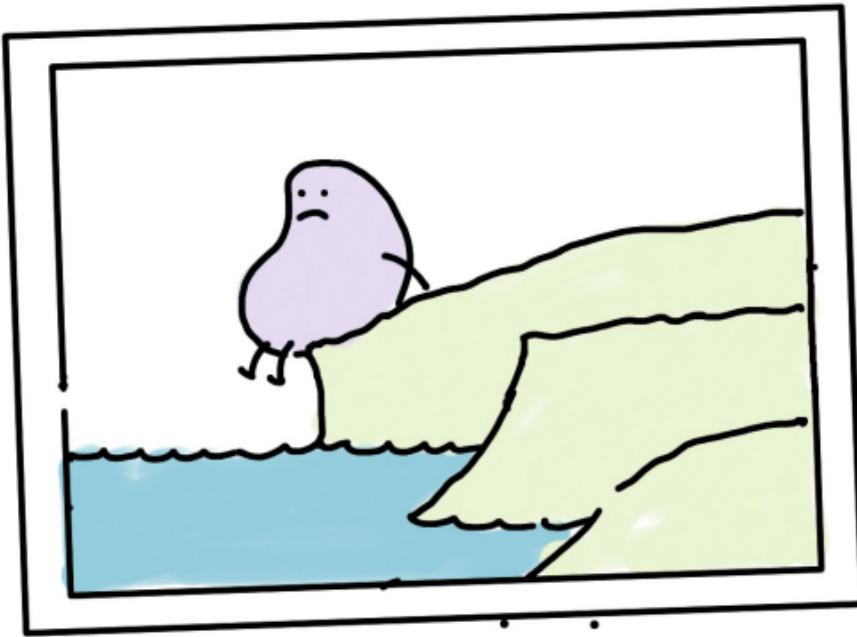

depending on what it is made of and what we have made of it.

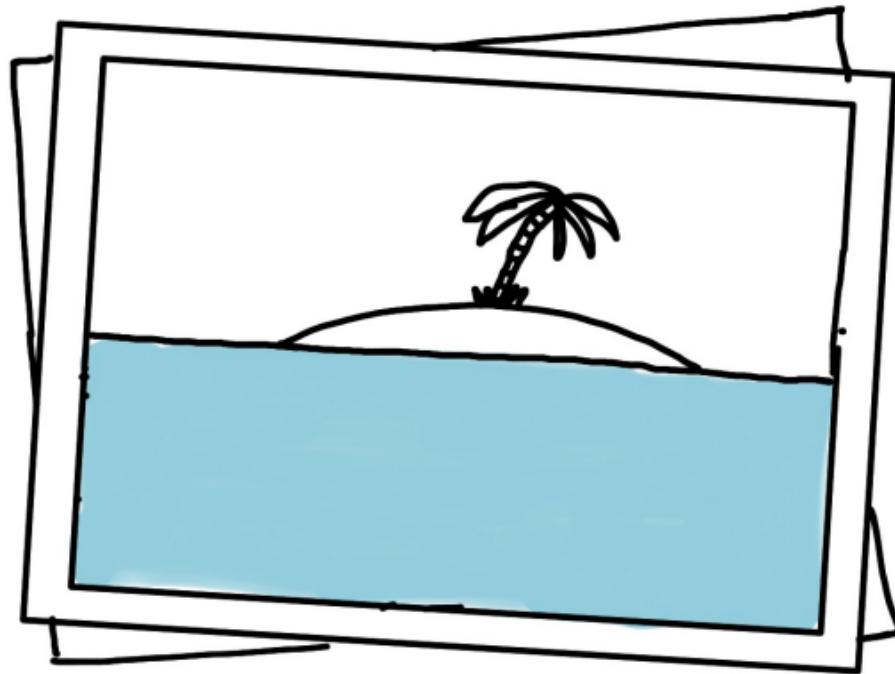

Some submerge

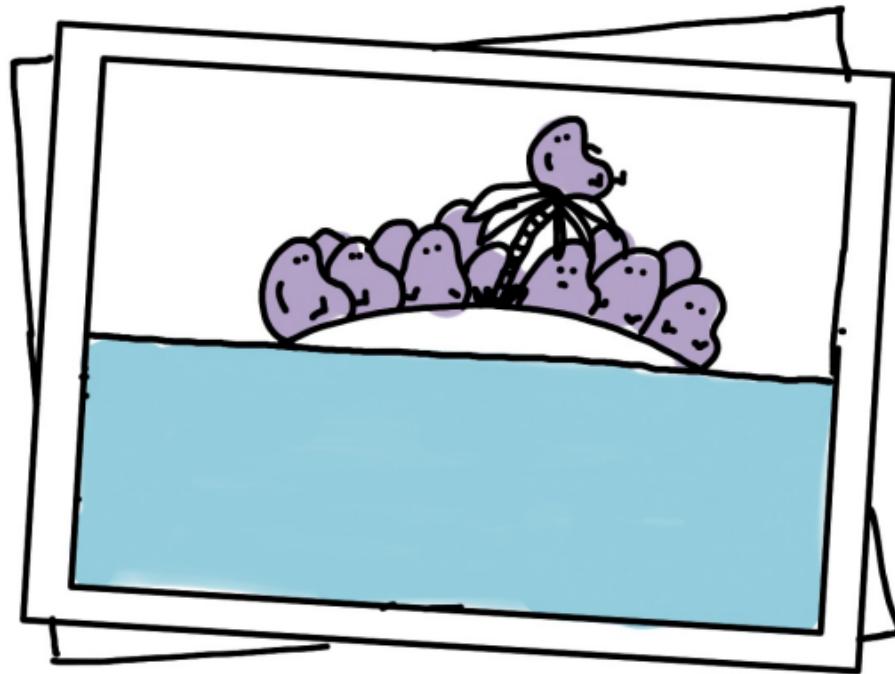

some subside

some even uplift!

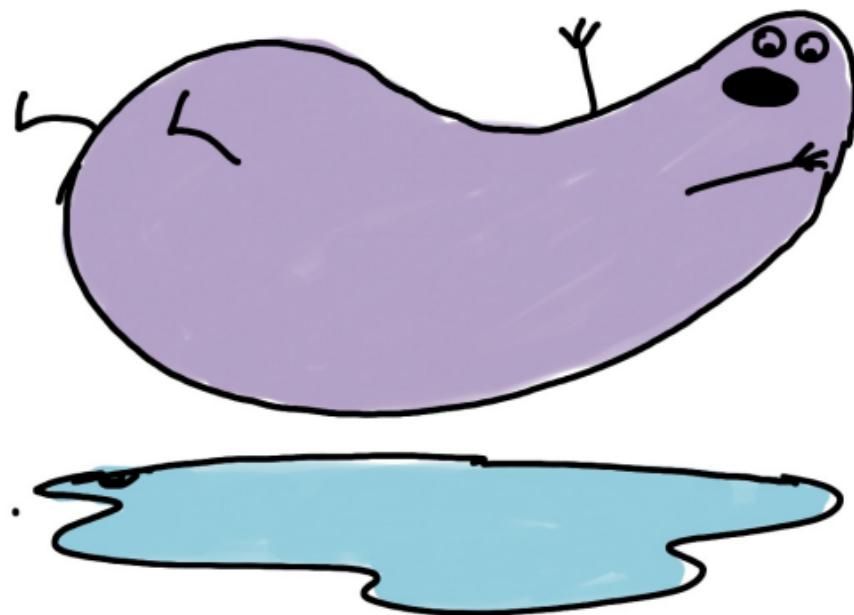

Some are at low risk and unpopulated

some are at high risk and overpopulated

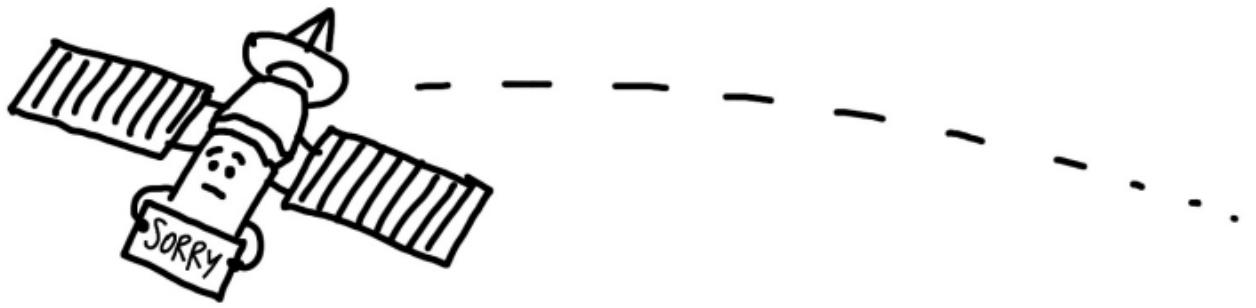

So forget that bathtub image

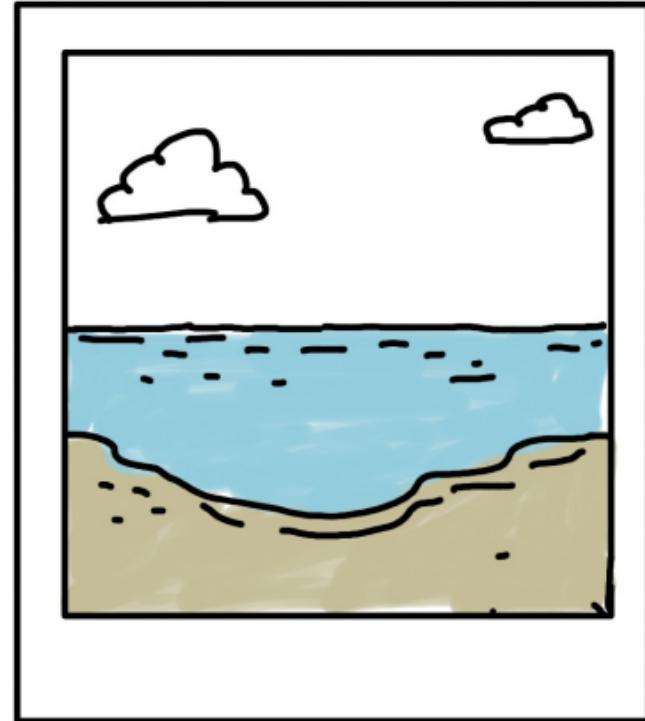

it's more complicated than that.

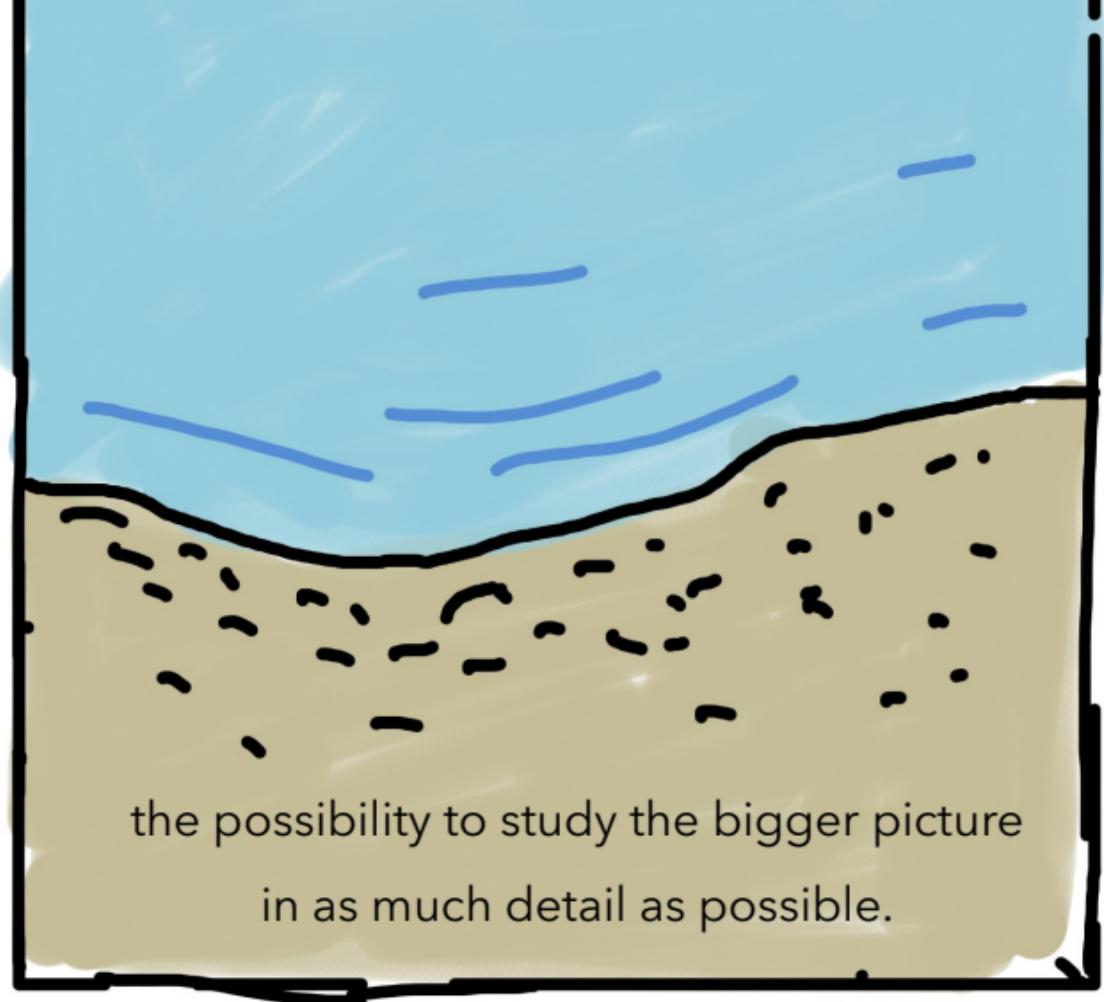

How can your pictures help, then?

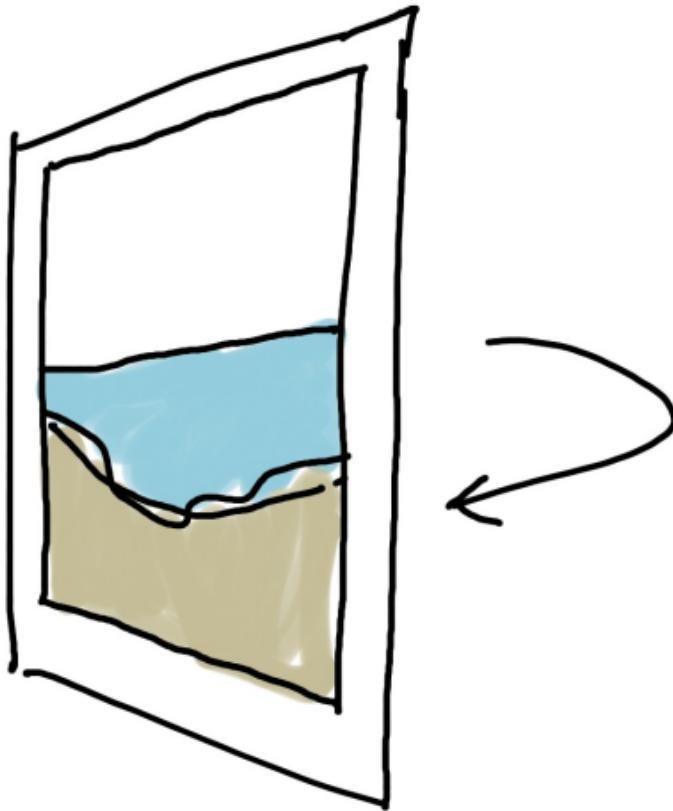

In a nutshell, your pictures will give science what satellites cannot

a close-up image of a coast

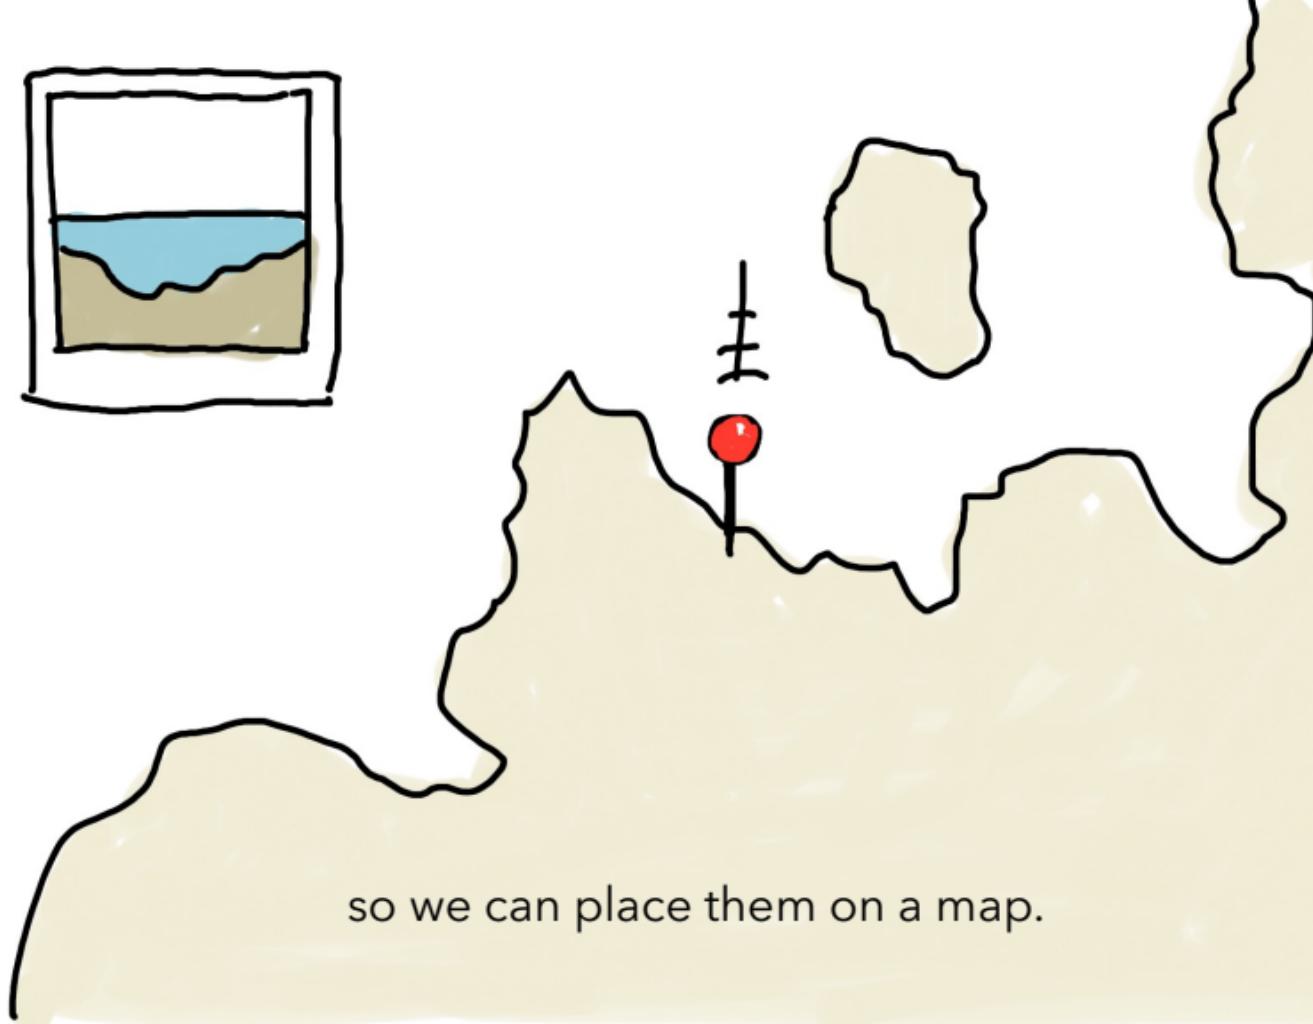

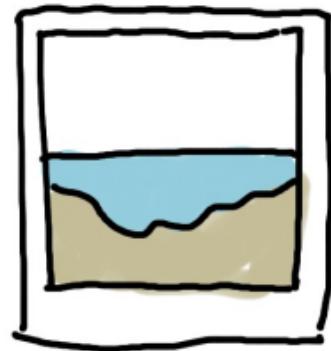

the possibility to study the bigger picture
in as much detail as possible.

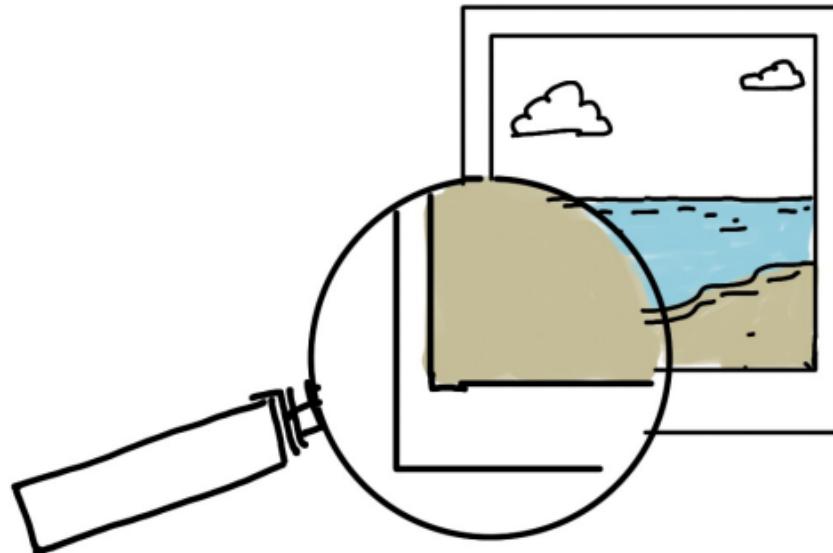

First, they will be checked for information on the location they were taken

mmmm mrs
mm m mm ,
mm m mm
m m m
m m n
mm mm mm m LAT
mm mm mm mm LONG
mm mm mm ,

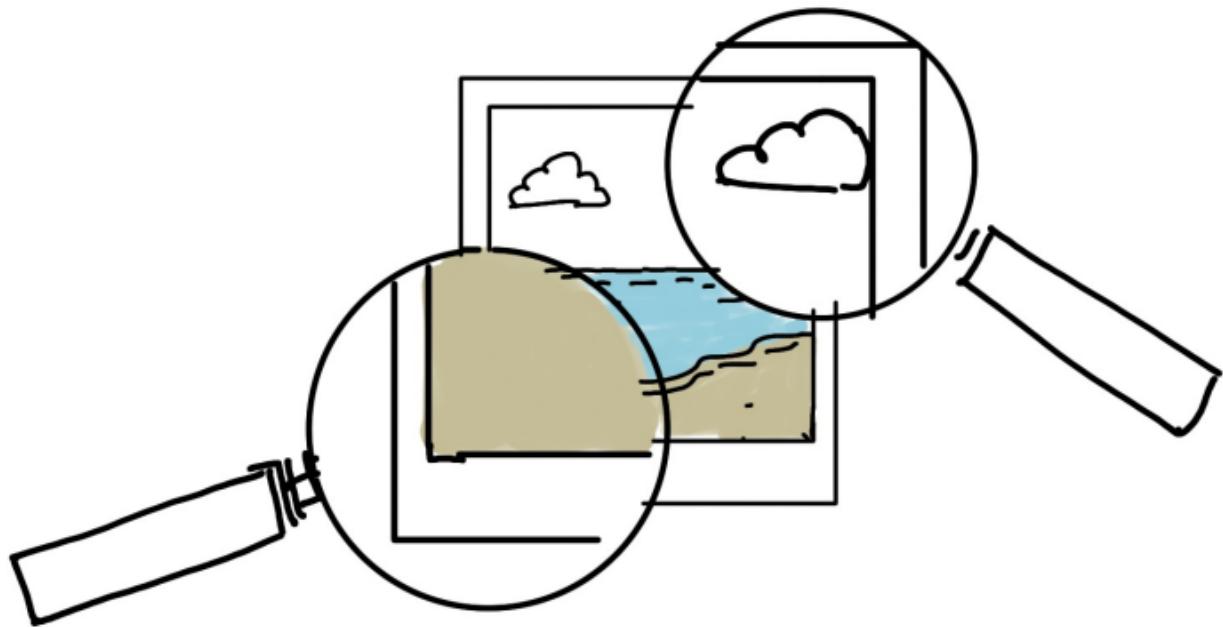

First, they will be checked for information on the location they were taken

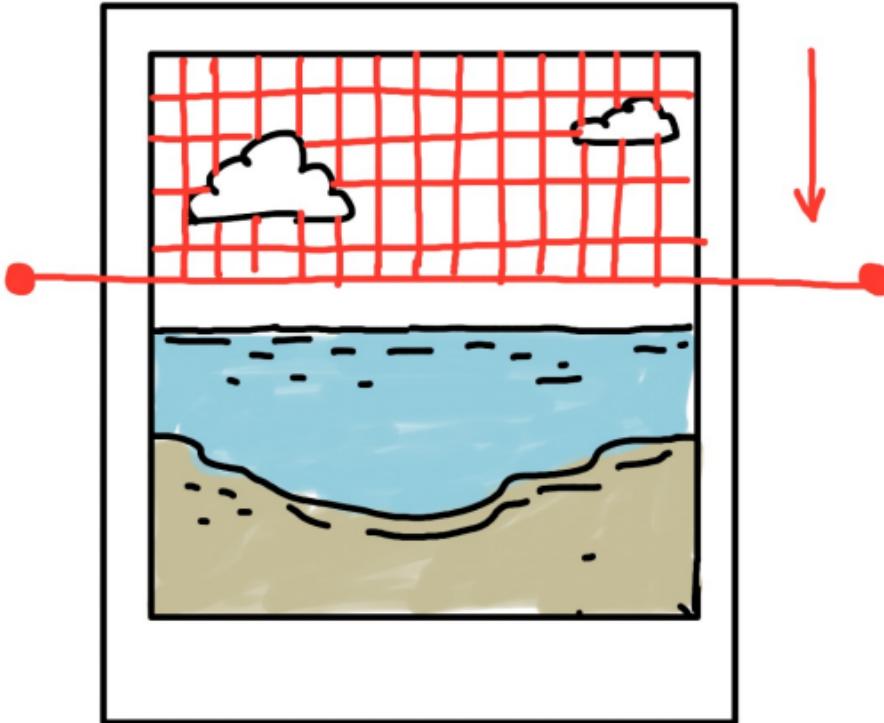

so we can place them on a map.

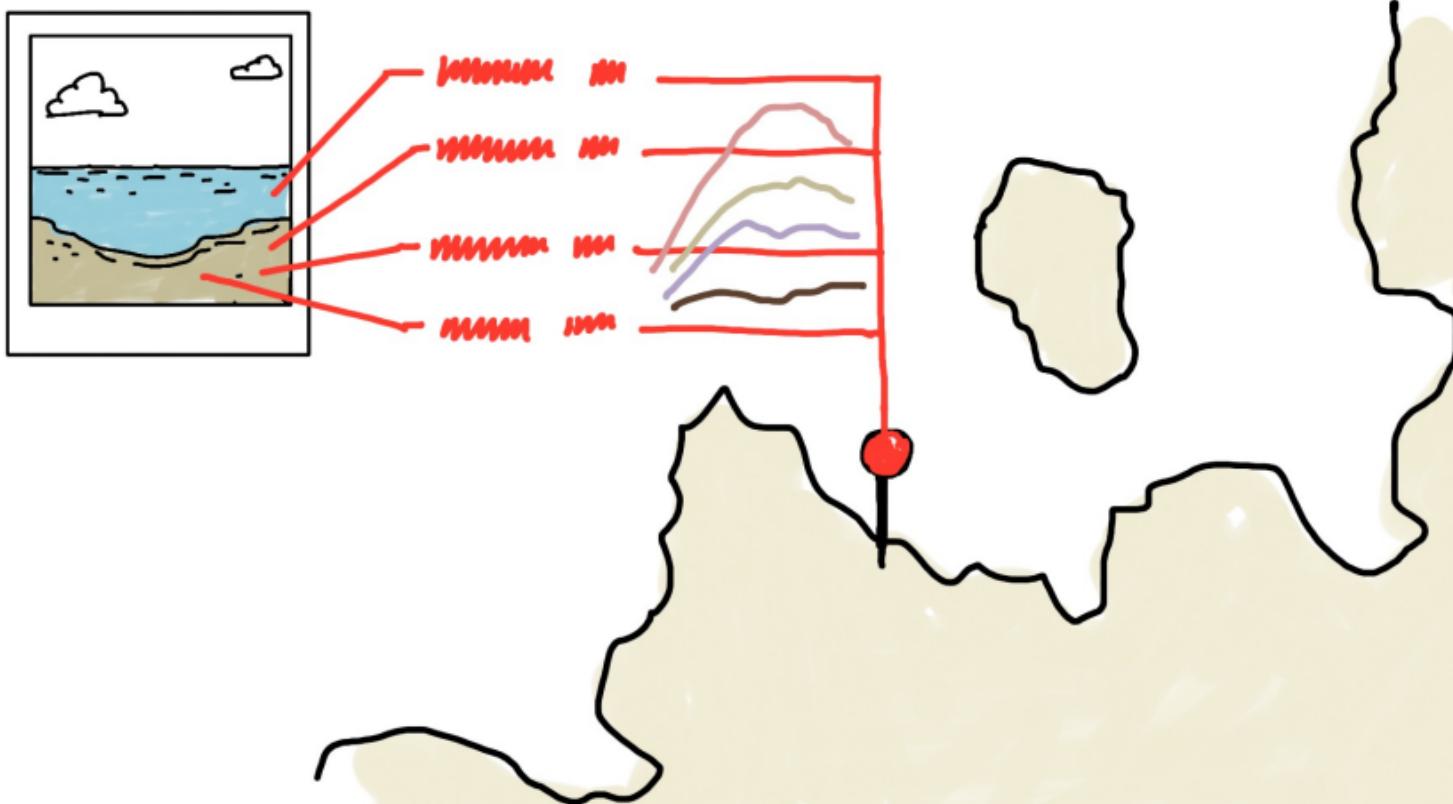

Then they will be analysed by scientists

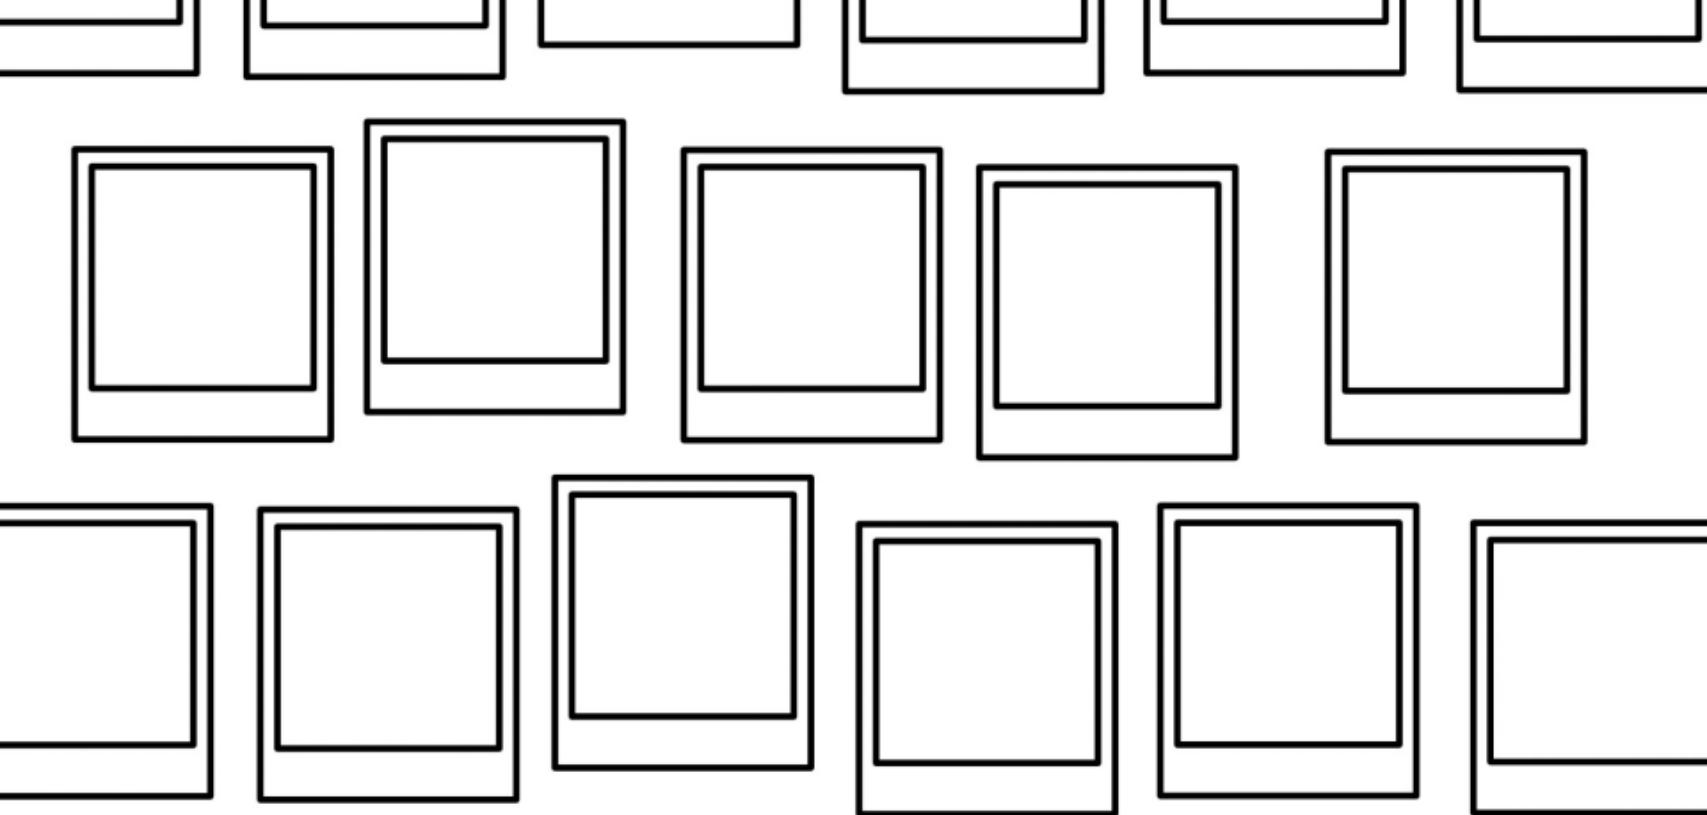

citizen scientists

(and maybe some day computers)

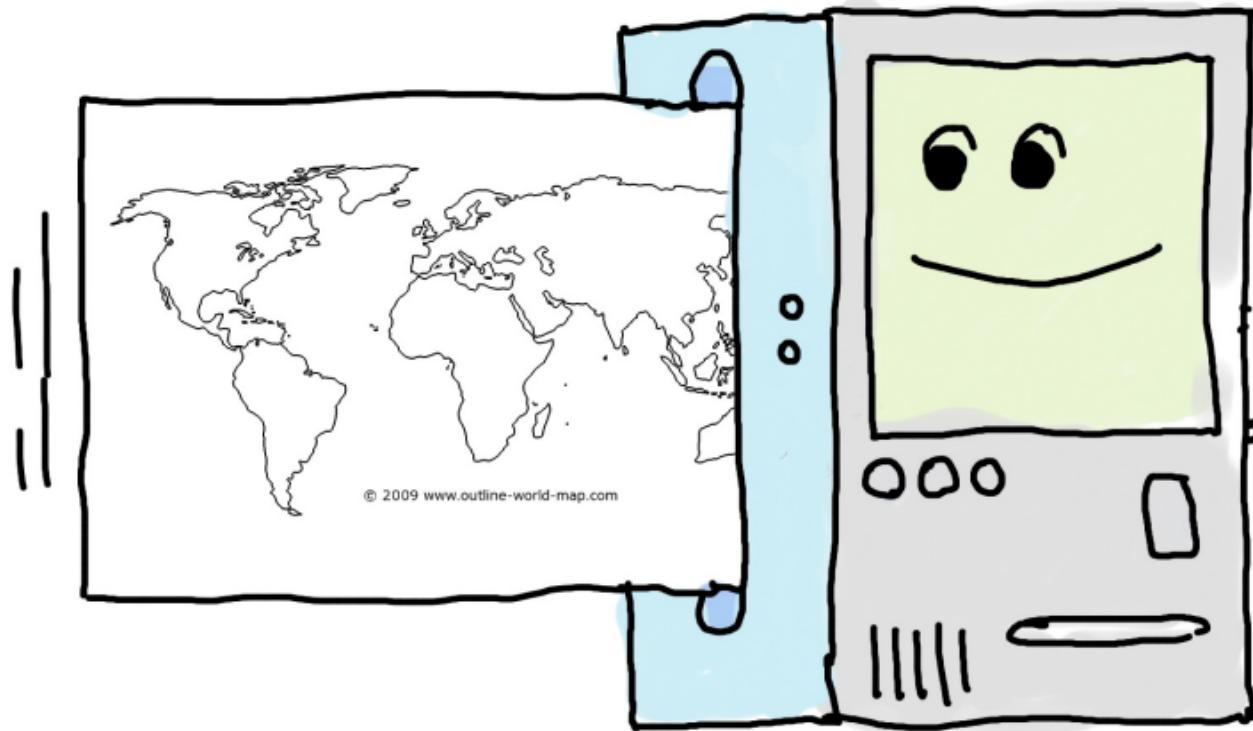

to determine the type of the coast at that location.

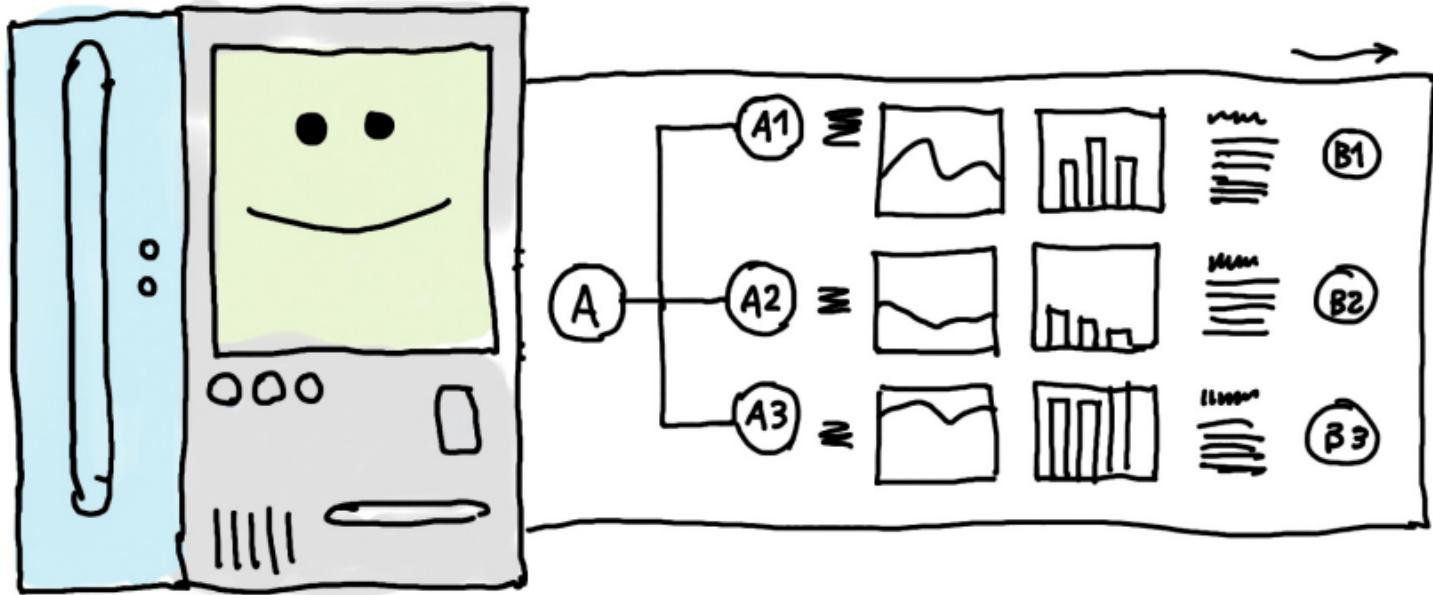

The more pictures are analysed,

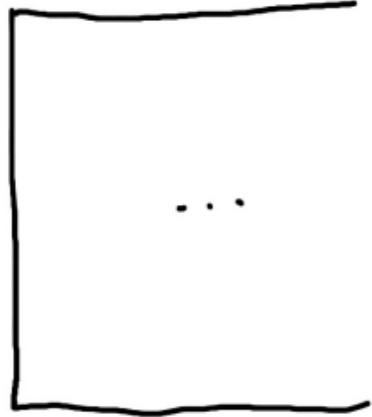

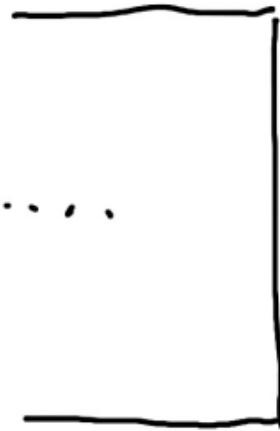

the more detail is added to a global map
of what types of coasts exist and where.

This map is then fed into computer programs

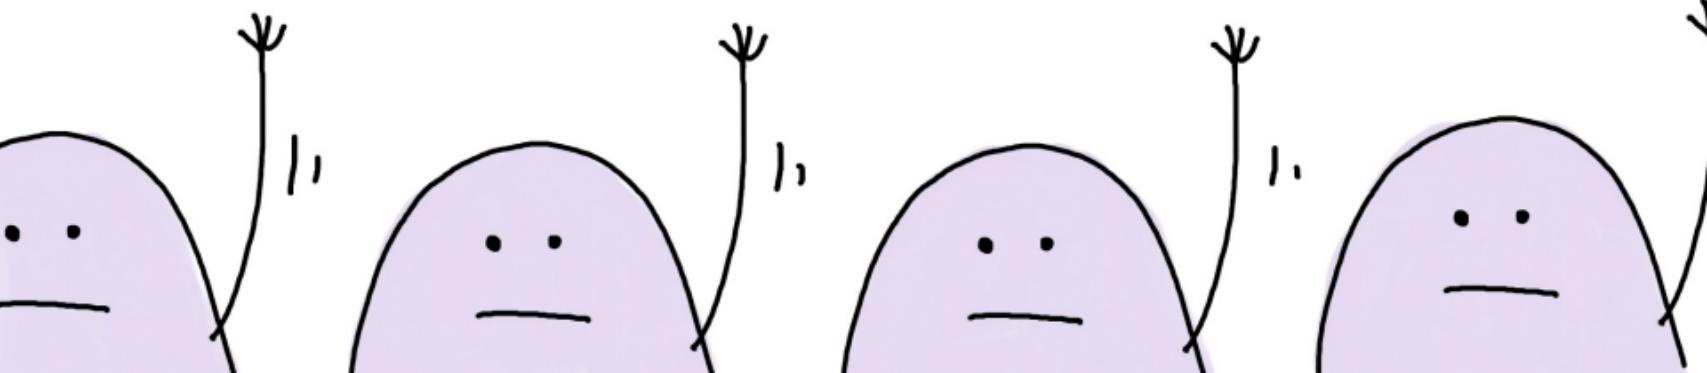

that help scientists make predictions on
how different coasts react under different circumstances.

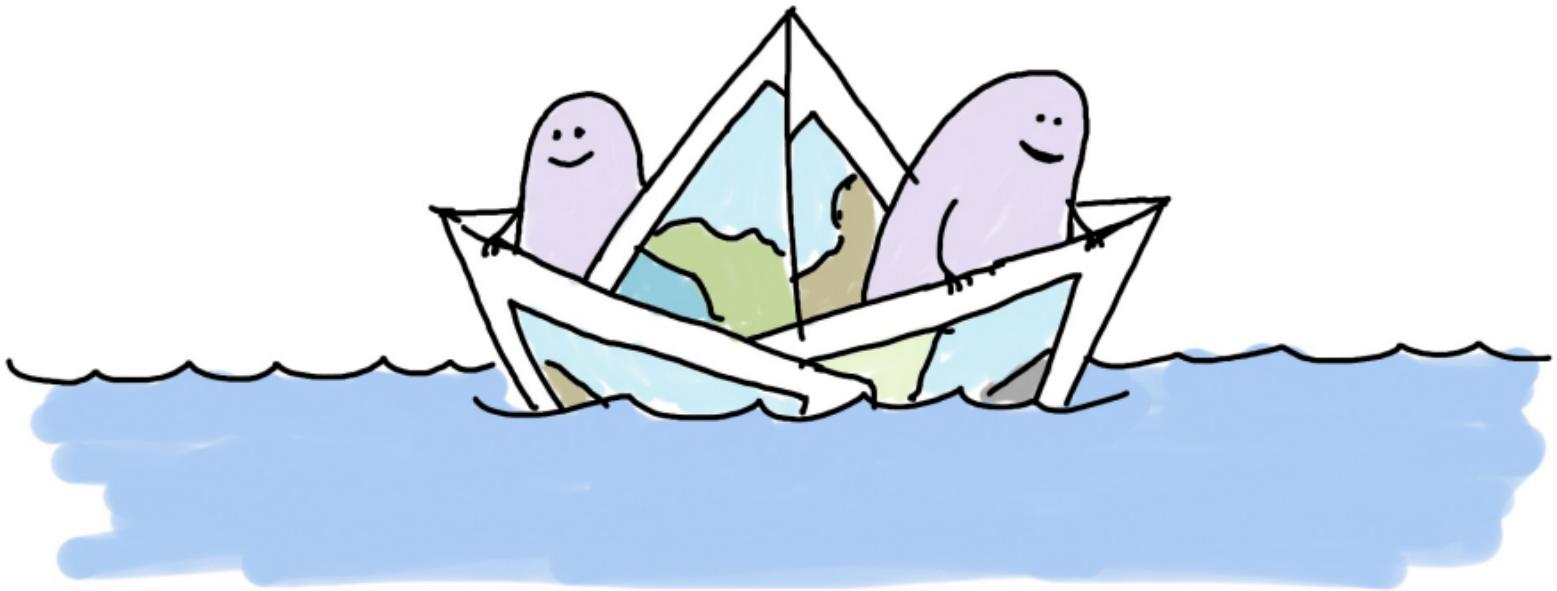

And these predictions inform policy makers
at international and national levels

on which actions to take and which countries
are in need of international help.

Your pictures help science give their best advice on how to protect ourselves, our children and our grandchildren from sea-level rise.

Together we can create a global map of coasts.

It's easy.

It's beautiful.

And it will make a difference!
